Background

Etanercept with trade name Enbrel, is an FDA-approved drug to treat rheumatoid arthritis, juvenile idiopathic arthritis and psoriatic arthritis, plaque psoriasis and ankylosing spondylitis. Etanercept is a fusion protein made from the combination of two naturally occurring soluble human 75-kilodalton TNF receptors linked to an Fc portion of an IgG1. Etanercept treats autoimmune diseases by interfering with tumor necrosis factor-alpha (TNF α , a soluble inflammatory cytokine) by acting as a TNF α inhibitor.
